

**Exhibit D**  
**Company Support for Research Programs**

NeuroPace<sup>®</sup> is a small science-driven company founded in 1997 to develop a responsive neurostimulator for the treatment of epilepsy. NeuroPace's first product, the RNS<sup>®</sup> System was approved by FDA for treatment of medically intractable partial seizures in late 2013 after 18 years of technical and more than a decade of clinical development. Many of the same people that supported the technical and clinical development of the RNS<sup>®</sup> System are still at NeuroPace and participate in external research collaborations. NeuroPace is not able to provide in-kind resources. However, the accessories and methods developed to support research using the RNS<sup>®</sup> System will be available to NeuroPace research collaborators if funding is allocated for these resources.
